

Preoperative Resilience Among Patients Undergoing Sports, Trauma, and Reconstructive Surgery

Michael Hewitt, BA; Sara Buckley, DO; U-COSMOS Program; Kenneth Hunt, MD

Disclosures

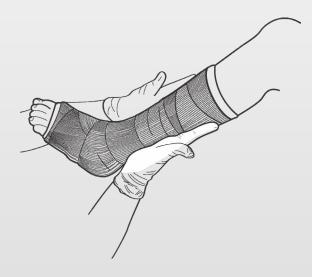

No relevant disclosures

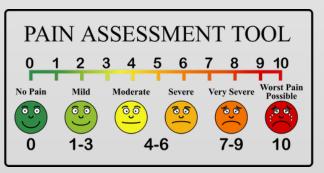

Resilience

- "The ability to bounce back or recover from stress" – Smith 2008
- Factors like resilience and self-efficacy play an important role in perception of musculoskeletal pain
- Role of patient resilience in foot and ankle surgery has not been broadly studied

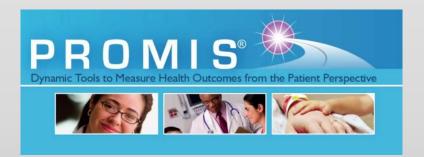

Goal

 Determine if pre-operative patient resilience is associated with physical or mental health patientreported outcomes

Brief Resilience Scale (BRS)

X

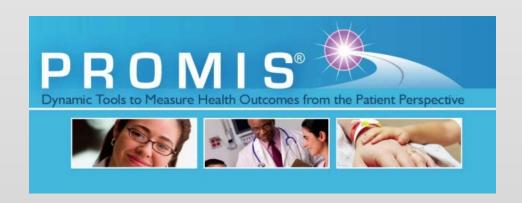

Methods - Outcomes collected

- Consecutive patients enrolled in the U-COSMOS* platform
- Patients undergoing foot and ankle surgery
- Dates: 2019 2023
- PROs Collected:
 - Brief Resilience Scale
 - PROMIS Physical Function CAT
 - PROMIS Pain Interference CAT
 - PROMIS Depression

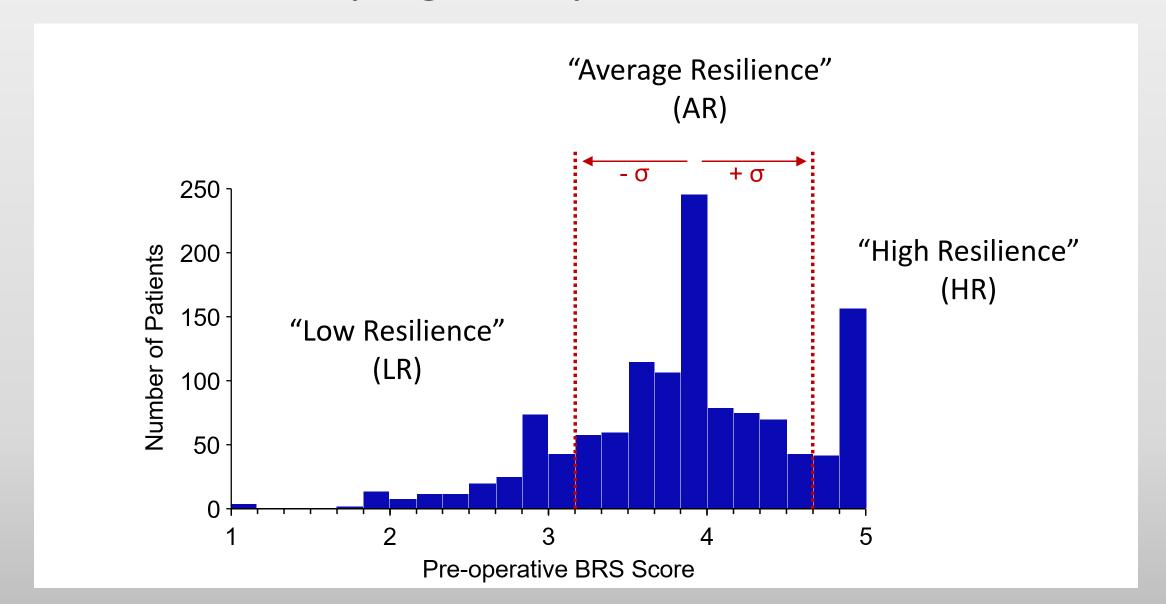

*University of Colorado Orthopaedic Surgery Monitoring of Outcomes System

Methods – Grouping Pre-operative Resilience

Results

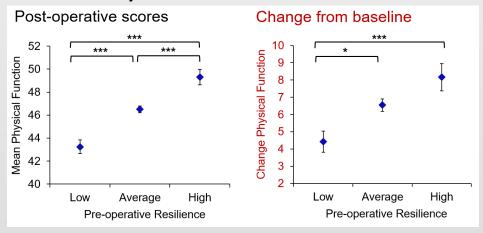

- N = 1389
- All surgeries included
- Minimum 6-month follow-up
- Used longest follow-up available
- Average follow-up 354 days

Patient Demographics (N=1389)	
Follow-up (days)	
Mean (SD)	354 (±187)
Age	
Mean (SD)	51.5 (±16.0)
Gender	
Female	824 (59.3%)
Male	565 (40.7%)
Race	
White	1187 (85.5%)
Black or African American	29 (2.1%)
Asian	26 (1.9%)
American Indian or Alaska Native	5 (0.4%)
Other Race	66 (4.8%)
Missing	76 (5.5%)
Laterality	
Left	697 (50.2%)
Right	669 (48.2%)
Missing	23 (1.7%)

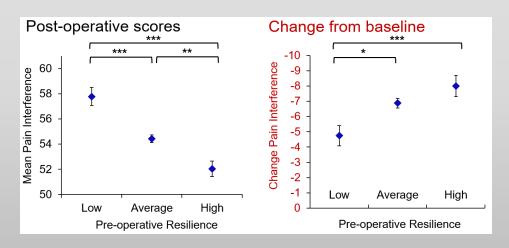

Results – Patient-reported outcomes

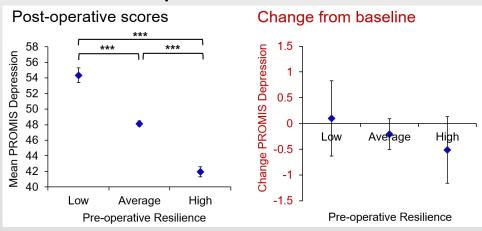

PROMIS Physical Function

PROMIS Pain Interference

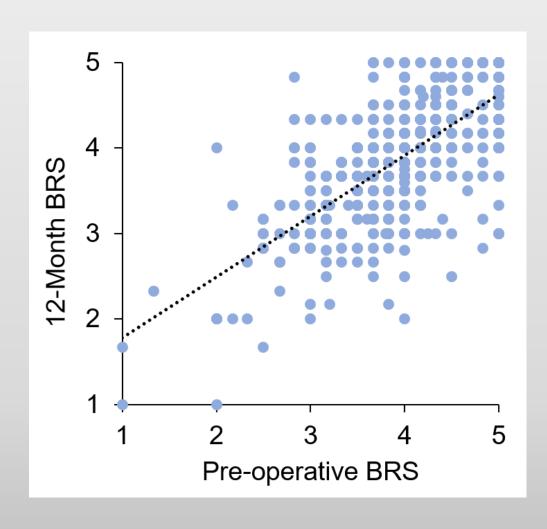

PROMIS Depression

While change is seen from preoperative baseline for physical health scores, change from baseline is not seen for mental health scores

Resilience consistent over time

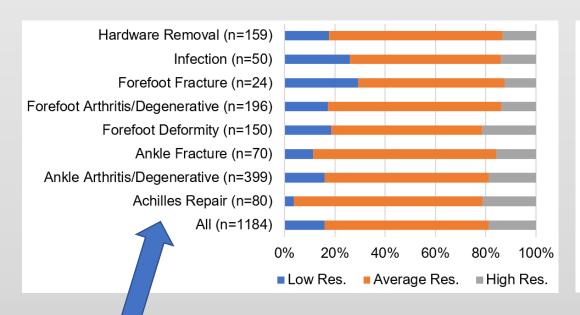

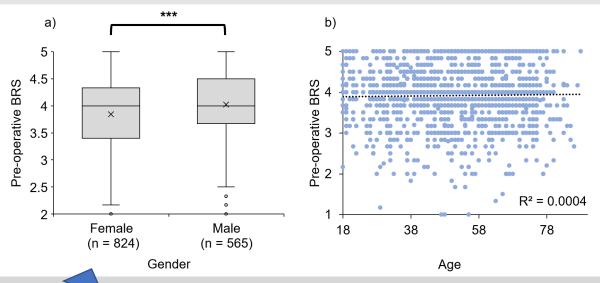

- Test-Retest Reliability
- n = 527
- r = 0.69
- p < 0.001

Average reported resilience is similar among different patient populations

Only 4% of Achilles rupture patients report low resilience (16% of total patients report low resilience)

Minor (though statistically significant) difference between males and females

Summary

- High resilience patients report higher <u>post-op scores</u> in all PROs compared to average and low resilience patients (p < 0.001)
- High resilience patients report greater <u>improvement</u> of scores for physical health PROs compared to average and low resilience patients (p < 0.001)
- Resilience consistent following surgery

Future Directions

Identify <u>Risk Factors</u> that Influence Resilience

- Injury severity
- History of prior injury
- Opioid use
- Social or demographic factors

Identify <u>Interventions</u> to Promote Resilience

- Improved surgical outcomes
- <u>Lasting</u> resilience shown between timepoints

Resilience Score
