Biomechanical Effect of Allograft Compression in ACL Reconstruction: A Cadaveric Study

Rafael Calvo R., Jorge Isla, Minerva Itriago

Clínica Alemana de Santiago, CAS-UDD Faculty of
Medicine – Hospital Salvador

Conflict of Interest

- Nothing to disclosure

ISAKOS
CONGRESS

MUNICH
GERMANY
June 8-11

Introduction

- Minimum graft diameter: ≥ 8 mm for hamstring grafts

- Larger grafts offer more resistance

Clinical challenge: small patients (e.g., women, children) may have limited space

Unknown impact of compressing larger grafts to smaller diameters

Hypothesis: Compressed grafts retain similar biomechanical resistance

Objectives

Primary Objective

- To evaluate if compressed allografts maintain biomechanical resistance despite reduced diameter

Secondary Objective

- To explore compression techniques for use in smaller patients

ISAKOS
CONGRESS

Materials and Methods

Cadaveric, biomechanical, case-control study

- 30 peroneus longus allografts
- 20 grafts (9 mm diameter)
- 10 grafts (8 mm diameter)

- Group A: Native 9 mm grafts

- Group B: 9 mm compressed to 8 mm

- Group C: Native 8 mm grafts

MUNICH
GERMANY
June 8-11

Materials and Methods

Machine: Zwick / Roell Z005

- Cyclic loading: 50–250 N at 1 Hz for 1000 cycles
- Then: continuous traction until failure

Results

Maximum Failure Force (Mean \pm SD):

- Group A: 1902 N \pm 432.12
- Group B: 1608 N \pm 233.12
- Group C: 1341 N \pm 936.67

Statistically significant difference between **Group A and B**

No significant difference between Groups B and C

Trend: Compressed grafts stronger than native 8 mm

Discussion

Compression reduces resistance but remains clinically acceptable

Useful technique for smaller anatomical knees

Balance between diameter, resistance, and anatomical feasibility

Compression may preserve more biomechanical properties than smaller grafts

ISAKOS

Conclusions

Compressed group had less strength than the original grafts (9 mm diameter, maximum strength of 1902 N vs. 1608 N for the compressed one).

When compared to the smaller graft, there was no significant difference between the compressed group and the smaller group; however, the compressed group showed a trend toward greater strength than the smaller graft.
